

## Residential Inspection High Impact Checklist

Determine the Compliance Path for the project:

- Projects using the Prescriptive Path and using the U-factor alternative or Total UA alternative (R402.1.4 (5) must have documentation in the project file that provides the calculated insulation and window efficiencies.
- Projects using the R405 Simulated Performance Path or the R406 Energy Rating Index path must have a Compliance Report including Performance Path or ERI inspection checklists in the project files.
- If the alternative compliance documentation was not submitted and approved at Plan Review, the inspector must inspect the project as a prescriptive compliance project using the checklist below.

Phase	Code Requirement	What to look for
<b>1. Plan Review</b>	Construction drawings and documentation demonstrate energy code compliance for the building envelope, lighting and mechanical systems.	<ul style="list-style-type: none"> <li>• For the correct code edition.</li> <li>• Review for unusual items like unusually high SEER ratings and HVAC efficiencies, wall and ceiling R-values over 15 &amp; 38 respectively, unusually low SGHC and U-factors, unusually low duct leakage and blower door leakage values, &lt;800 sq. ft. per ton of cooling, or other irregularities.</li> </ul>
<b>2. Plumbing Rough-in</b>	Hot water lines insulated with minimum R-3. N1103.5/R403.5	<ul style="list-style-type: none"> <li>• Inspect for insulation on hot water lines - 3/4" in diameter or larger, or any lines buried, under slab, supplying a recirculation system, piping to a manifold, or outside conditioned space.</li> </ul>
<b>3. Framing / Insulation Inspection</b>	Window SGHC & U-factor, Door U-factor.	<p>Check SGHC and U-factor numbers on NFRC labels.</p> <ul style="list-style-type: none"> <li>• In Climate Zone 2 you are looking for a U-factor <math>\leq .40</math> and a SHGC <math>\leq .25</math>.</li> <li>• In Climate Zone 3 -U-factor <math>\leq .35</math> and a SHGC <math>\leq .25</math>.</li> <li>• In Climate Zone 4 - U-factor <math>\leq .35</math> and a SHGC <math>\leq .40</math>.</li> </ul>
	Air and thermal barrier installed correctly and as per Table N1102.4.1.1/R402.4.1.1	<ul style="list-style-type: none"> <li>• Air barrier must be continuous, with all penetrations sealed. If you can see daylight through the wall from the inside of the house, the air barrier is not sealed.</li> <li>• Attic "hot/knee walls" must have an approved air barrier on the attic side.</li> <li>• Base plates must be sealed to the floor, with foam used in headers, penetrations through top plate sealed, and gaps around the perimeter of windows sealed.</li> <li>• Can lights must be gasketed, air-tight and IC rated.</li> <li>• Corners and Ts must allow for insulation (California corners and ladder framed T's)</li> </ul>

	Insulation installed correctly. Table N1102.4.1.1/R402.4.1.1	<ul style="list-style-type: none"> <li>• Check for proper R-value, no gaps, voids, compression of batts or misalignment.</li> <li>• Double check insulation is properly cut around wiring and other obstacles.</li> <li>• Blown-in fiberglass in walls should be firm to the touch.</li> <li>• HVAC walkways and other ceiling areas where blown may not reach are properly insulated,</li> <li>• Rim joists must be insulated, baffles installed at soffit vents.</li> <li>• Check that attic access hatches are sealed and insulated.</li> <li>• See this video for proper batt insulation installation: <a href="https://www.youtube.com/watch?v=OXSV1Ws-HCc">https://www.youtube.com/watch?v=OXSV1Ws-HCc</a></li> </ul>
	Supply duct at least R-8, return duct at least R-6	<ul style="list-style-type: none"> <li>• See that ducts are properly sealed, supported and installed per manufacturer's instructions</li> <li>• See this for more info: <a href="http://www.flexibleduct.org/images/ADC~IR5E.pdf">http://www.flexibleduct.org/images/ADC~IR5E.pdf</a></li> </ul>
	Combustion air IRC G2407	<ul style="list-style-type: none"> <li>• Check for outdoor combustion air to all fuel burning appliances and fireplaces.</li> </ul>
<b>4. Final</b>	Ceiling insulation R-values and depth markers N1103.1.1/R303.1.1 Table N1102.1.2/R402.1.2	<p>Confirm that the insulation corresponds with the R-value listed on permit documents:</p> <ul style="list-style-type: none"> <li>• In Climate Zones 2 &amp; 3 R-38 minimum.</li> <li>• In Climate Zone 4 – R49 minimum.</li> <li>• Confirm eave baffles at vented rafter bays</li> <li>• Check for insulation certificate.</li> </ul>
	Envelope and Duct Leakage Tests N1102.4/R402.4 N1103.3.3/R403.3.3	<ul style="list-style-type: none"> <li>• Testing for leakage to outside is not acceptable for code compliance.</li> <li>• Envelope Leakage – Code requires ≤5ACH 50 in CZ2, and 3 ACH50 in CZ 3&amp;4.</li> <li>• Duct leakage – Code requires total leakage ≤4 cfm per 100 square feet of conditioned floor area.</li> </ul>
	Lighting N1104.1.1/R404.1.1	<ul style="list-style-type: none"> <li>• At least 75% installed lighting high efficacy.</li> </ul>
	HVAC and Water Heating Efficiency N1103.7/R403.7	<ul style="list-style-type: none"> <li>• Check that HVAC and Water Heating equipment meets minimum national standards.</li> <li>• Confirm that installed equipment efficiency is the same as on plan submittal documents and on the mandatory posted certificate.</li> </ul>
	Slab edge Insulation Table N1102.1.2/R402.1.2	<ul style="list-style-type: none"> <li>• Climate Zone 4 requires a minimum R10 to depth of 2 feet .</li> </ul>
	Energy Certificate N1103.1/R403.1	<ul style="list-style-type: none"> <li>• Confirm that an Energy Certificate, completed and signed by builder or registered design professional, is posted.</li> </ul>
